# Disclaimer

SolidProof.io reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc’...)

**SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.**

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof’s position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

## Description

TBA

## Project Engagement

During the 1st of July 2022, **Battle Infinity Team** engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

# Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
<b>Critical</b>	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
<b>High</b>	7 – 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
<b>Medium</b>	4 – 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
<b>Low</b>	2 – 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
<b>Informational</b>	0 – 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

# Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

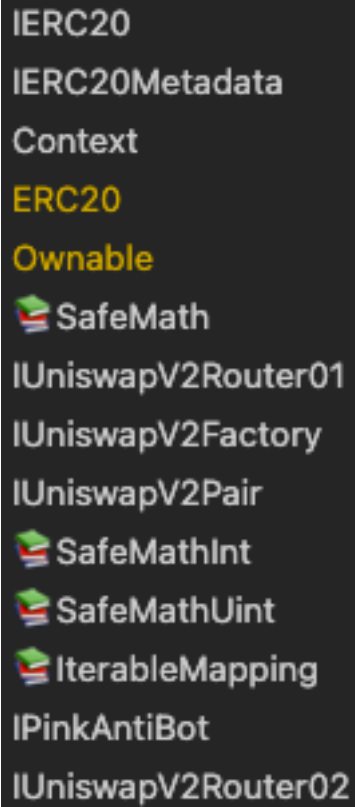

## **Methodology**

The auditing process follows a routine series of steps:

1. Code review that includes the following:
  - i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
  - ii) Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
  - iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
2. Testing and automated analysis that includes the following:
  - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
  - ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

## Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

IERC20  
IERC20Metadata  
Context  
ERC20  
Ownable  
SafeMath  
IUniswapV2Router01  
IUniswapV2Factory  
IUniswapV2Pair  
SafeMathInt  
SafeMathUint  
IterableMapping  
IPinkAntiBot  
IUniswapV2Router02

# Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

*A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.*

## v1.0

File Name	SHA-1 Hash
contracts/ibat.sol	002eb3778c3ea09b97328c8b364f9f84cf04eaaf

# Metrics

## Source Lines v1.0

## Risk Level v1.0

## Capabilities

### Components

Version	Contracts	Libraries	Interfaces	Abstract
1.0	3	4	7	1

### Exposed Functions

*This section lists functions that are explicitly declared public or payable. Please note that getter methods for public stateVars are not included.*

Version	Public	Payable
1.0	117	5

Version	External	Internal	Private	Pure	View
1.0	83	99	5	25	39

### State Variables

Version	Total	Public
1.0	39	28

### Capabilities

Version	Solidity Versions observed	Experimental Features	Can Receive Funds	Uses Assembly	Has Destroyable Contracts
1.0	<code>^0.8.1</code>		yes		

Version	Transfers ETH	Low-Level Calls	DelegateCall	Uses Hash Functions	EC Recover	New/Create/Create2
1.0	yes

## Scope of Work/Verify Claims

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

1. Is contract an upgradeable
2. Correct implementation of Token standard
3. Deployer cannot mint any new tokens
4. Deployer cannot burn or lock user funds
5. Deployer cannot pause the contract
6. Overall checkup (Smart Contract Security)

## Is contract an upgradeable

Name	
Is contract an upgradeable?	No

## Correct implementation of Token standard

ERC20				
Function	Description	Exist	Tested	Verified
TotalSupply	Provides information about the total token supply	✓	✓	✓
BalanceOf	Provides account balance of the owner's account	✓	✓	✓
Transfer	Executes transfers of a specified number of tokens to a specified address	✓	✓	✓
TransferFrom	Executes transfers of a specified number of tokens from a specified address	✓	✓	✓
Approve	Allow a spender to withdraw a set number of tokens from a specified account	✓	✓	✓
Allowance	Returns a set number of tokens from a spender to the owner	✓	✓	✓

## Write functions of contract v1.0

```
setEnabledAntiBot
setantiDumpEnabled
setantiDump
updateUniswapV2Router
setswapTokensAtAmount
excludeFromFees
excludeMultipleAccountsFromFees
setFoundationWallet
setGlobeStakeWallet
setLiquiditFee
setGlobeStakeFee
setFoundationFee
setFirstverifier
voteVerifierOne
voteVerifierOwner
startTrading
pauseTrading
setAutomatedMarketMakerPair
blacklistAddress
updateGasForProcessing
recoverothertokens
recoveretoken
renounceOwnership
transferOwnership
transfer
approve
transferFrom
increaseAllowance
decreaseAllowance
```

## Deployer cannot mint any new tokens

Name	Exist	Tested	Status
Deployer cannot mint	✓	✓	✓
Max / Total Supply	100000000000		

## Deployer cannot burn or lock user funds

Name	Exist	Tested	Status
Deployer cannot lock	✓	✓	✗
Deployer cannot burn	✓	✓	✓

Comments:

### v1.0

- Owner can lock user funds by
  - blacklisting addresses
  - Setting tradingEnabled to false
  - Setting too high fees

## Deployer cannot pause the contract

Name	Exist	Tested	Status
Deployer cannot pause	✓	✓	✗

Comments:

**v1.0**

- Owner can pause contract by setting tradingEnabled back to false

## Overall checkup (Smart Contract Security)

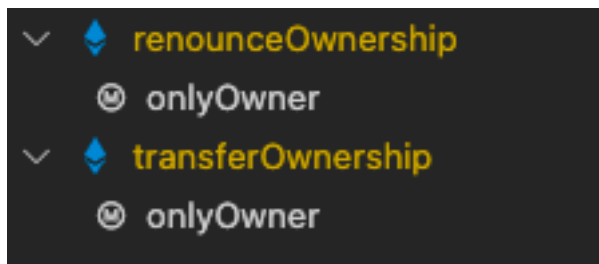

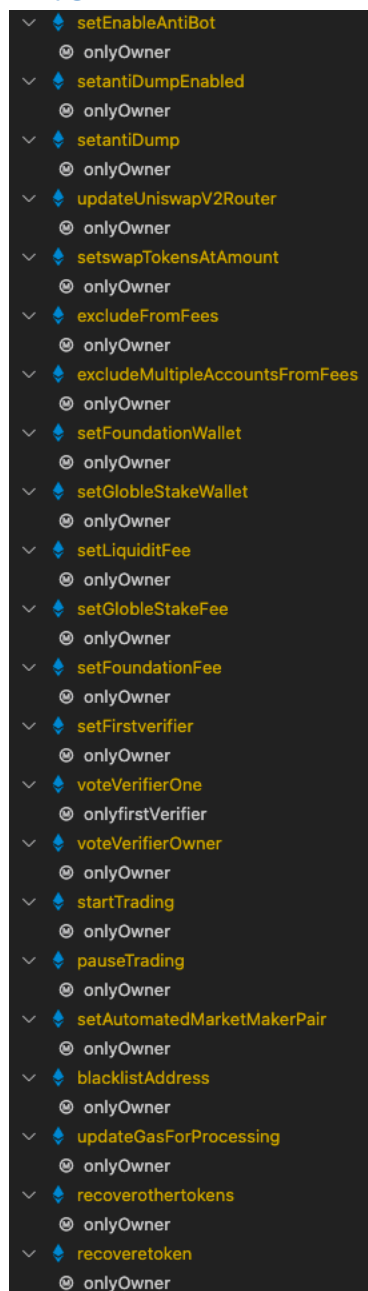

Tested	Verified
✓	✓

### Legend

Attribute	Symbol
Verified / Checked	✓
Partly Verified	⚠
Unverified / Not checked	✗
Not available	—

# Modifiers and public functions

## v1.0

## Comments

- Deployer can set following state variables without any limitations
  - antiDumpTime
    - The point that you are using the antidumpTime as minutes, we would recommend you to multiply by 1 minutes to make sure that you are calculation the dump time as minutes. Also we recommend you to laminate the anti dump amount and time.
  - antiDumpAmount
  - swapTokensAtAmount
  - liquidityFee

- foundationFee
- globeStakefee
- Deployer can enable/disable following state variables
  - antiBotEnabled
  - antiDumpEnabled
  - \_isExcludedFromFees
  - verifierOne
    - Can only be set by the first verifier
  - verifierOwner
  - tradingEnabled
  - automatedMarketMakerPairs
  - \_isBlacklisted
- Deployer can set following addresses
  - uniswapV2Router
  - uniswapV2Pair
  - \_foundationWalletAddress
  - \_globeStakeWalletAddress
  - firstVerifier
- Existing Modifiers
  - onlyOwner
  - onlyfirstVerifier
- Owner can
  - set first verifier, but he can verify himself as firstverifier and bypass “the owner cannot transfer before it is not verified”
  - Take out own contract tokens
    - We recommend to prevent passing own contract balance
  - Take out contract balance

**Please check if an OnlyOwner or similar restrictive modifier has been forgotten.**

# Source Units in Scope

## v1.0

Type	File	Logic Contracts	Interfaces	Lines	nLines	nSLOC	Comment Lines	Complex. Score	Capabilities
	contracts/ibat.sol	8	7	1502	1145	587	458	603	
	Totals	8	7	1502	1145	587	458	603	

### Legend

Attribute	Description
Lines	total lines of the source unit
nLines	normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)
nSLOC	normalized source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

# Audit Results

## AUDIT PASSED

### Critical issues

No critical issues

### High issues

No high issues

### Medium issues

Issue	File	Type	Line	Description
#1	Main	Take out tokens	1458	Owner is able to take out contract tokens with the "recoverothertokens" function. We highly recommend you to prevent own contract address from passing to function.

### Low issues

Issue	File	Type	Line	Description
#1	Main	Contract doesn't import npm packages from source (like OpenZeppelin etc.)	-	We recommend to import all packages from npm directly without flatten the contract. Functions could be modified or can be susceptible to vulnerabilities
#2	Main	A floating pragma is set	1	The current pragma Solidity directive is „^0.8.1“.
#3	Main	Missing Zero Address Validation (missing-zero-check)	1464 1216 1221 1193	Check that the address is not zero

#4	Main	Missing Events Arithmetic	1244 1236 1237 1230 1231 1225 1226 1183 1184 1197	Emit an event for critical parameter changes
----	------	---------------------------	--	--

## Informational issues

Issue	File	Type	Line	Description
#1	Main	State variables that could be declared constant (constable-states)	1074 1072 1097 1070	Add the `constant` attributes to state variables that never change
#2	Main	Functions that are not used	1467	Remove unused functions.  Before removing check the function, it could be possible, that you forget to implement it into the contract
#3	Main	Unused state variables	856	Remove unused state variables
#4	Main	Misspelling	See description	Change following words: <ul style="list-style-type: none"> <li>- requestnetwork L826</li> <li>- gobleStakefee L1084</li> <li>- exlcude L1108</li> <li>- tokensIntoLiquidity L1138</li> <li>- setGobleStakeFee L1229</li> <li>- afer L1336</li> <li>- gobleStakefee L1395</li> <li>- recoveretoken L1463</li> </ul> <p>Make sure to change it everywhere else as well.</p>
#5	Main	NatSpec documentation missing	-	If you started to comment your code, also comment all other functions, variables etc.

## Audit Comments

We recommend you to use the special form of comments (NatSpec Format, Follow link for more information <https://docs.soliditylang.org/en/v0.5.10/natspec-format.html>) for your contracts to provide rich documentation for functions, return variables and more. This helps investors to make clear what that variables, functions etc. do.

### 04. July 2022:
