## **Disclaimer**

<u>SolidProof.io</u> reports are not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc'...)

SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof's position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

# **Description**

Polkastream is poised to be the next innovative addition to the Polkadot parachain system by building an integrated and intelligently monetized platform for the Web 3.0 streaming and gaming market. On the Polkastream platform, users can listen to music and podcasts, watch movies and TV shows, as well as socialize and play over 40 games in the Polkaverse. In return, streamers and gamers are rewarded with the \$PSTR token, which is uniquely designed with incentivization and token-burning strategies for better rewards, long-term crypto market stability, and data security for all digital media users.

# **Project Engagement**

On January 7, 2023, the **Polkastream.io Team** contacted Solidproof.io to audit the **\$PSTR** smart contract that they developed. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the smart contract. On January 12, the **Polkastream.io Team** further requested to audit the **\$PSTR** tokenomics. They provided Solidproof.io with access to the \$PSTR GitHub code repository at <a href="https://github.com/polkastream/pstr">https://github.com/polkastream/pstr</a> and whitepaper.

# **Vulnerability & Risk Level**

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

| Level         | Value   | Vulnerability   | Risk (Required Action)  |
|---------------|---------|---|---|
| Critical      | 9 - 10  | A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.      | Immediate action to reduce risk level.                              |
| High          | 7 – 8.9 | A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way. | Implementation of corrective actions as soon aspossible.            |
| Medium        | 4 – 6.9 | A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.                                     | Implementation of corrective actions in a certain period.           |
| Low           | 2 – 3.9 | A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.       | Implementation of certain corrective actions or accepting the risk. |
| Informational | 0 – 1.9 | A vulnerability that have informational character but is not effecting any of the code.   | An observation that<br>does not determine a<br>level of risk        |

# Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, the contract was reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as their were discovered.

# Methodology

The auditing process follows a routine series of steps:

- 1. Code review that includes the following:
  - i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
  - ii) Manual review of code, which is the process of reading source code line-byline in an attempt to identify potential vulnerabilities.
  - iii) Comparison to specification, which is the process of checking if the code does what it is supposed to according to the specifications, sources, and instructions that were provided to Solidproof.
- 2. Testing and automated analysis that includes the following:
  - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
  - ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
- 3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
- 4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

# **Used Code from other Frameworks/Smart Contracts (direct imports)**

Imported packages:

IERC20 Ownable

# **Tested Contract Files**

This audit covered the following files listed below with a SHA-1 Hash.

A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.

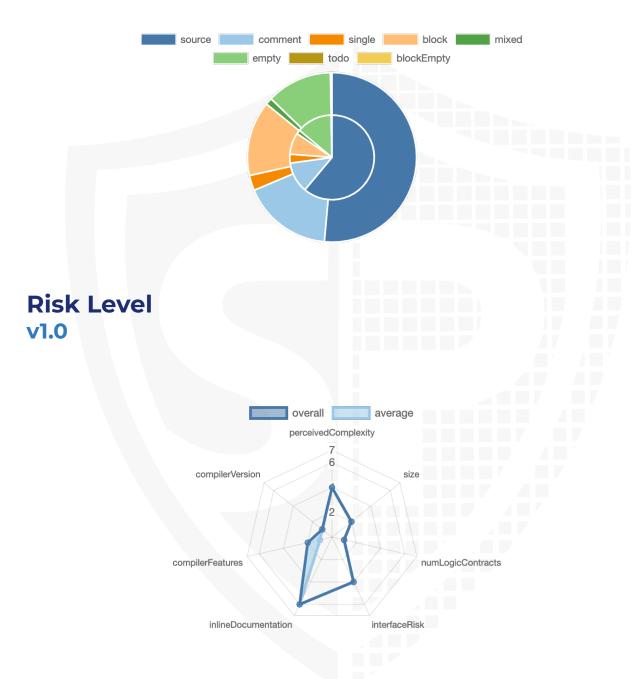

#### **v1.0**

| File Name              | SHA-1 Hash                               |
|------------------------|--|
| contracts/contract.sol | 3c03135a94ff9b369c35f36069fe2f3d36b58644 |

# **Metrics**

# Source Lines v1.0

# **Capabilities**

## **Components**

| Version | Contracts | Libraries | Interfaces | Abstract |
|---------|-----------|-----------|------------|----------|
| 1.0     | 1         | 0         | 1          | 1        |

# **Exposed Functions**

This section lists functions that are explicitly declared public or payable. Please note that getter methods for public stateVars are not included.

| Version | Public Payable |   |
|---------|----------------|---|
| 1.0     | 37             | 0 |

| Version | External | Internal | Private | Pure | View |
|---------|----------|----------|---------|------|------|
| 1.0     | 10       | 34       | 17      | 5    | 17   |

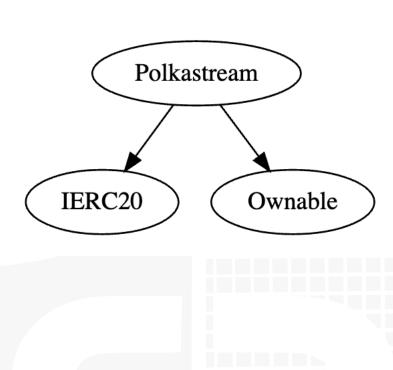

## **State Variables**

| Version | Total | Public |
|---------|-------|--------|
| 1.0     | 29    | 13     |

# **Capabilities**

# Inheritance Graph v1.0

# **CallGraph**

## v1.0

# Scope of Work/Verify Claims

The Polkastream Team provided us with the \$PSTR smart contract files via its GitHub repository at <a href="https://github.com/polkastream/pstr">https://github.com/polkastream/pstr</a>. The scope of the audit is the main contract (usually the same name as the team appended with .sol).

We will verify the following claims:

- 1. Is the contract upgradeable
- 2. Correct implementation of Token standard
- 3. Deployer cannot mint any new tokens
- 4. Deployer cannot burn or lock user funds
- 5. Deployer cannot pause the contract
- 6. Deployer cannot set fees
- 7. Deployer cannot blacklist/antisnipe addresses
- 8. Overall checkup (Smart Contract Security)

# Is the contract upgradeable

| Name                         |    |
|------------------------------|----|
| Is the contract upgradeable? | No |

# **Correct implementation of Token standard**

|              | ERC20   |              |          |              |  |  |
|--------------|---|--------------|----------|--------------|--|--|
| Function     | Description   | Exist        | Tested   | Verified     |  |  |
| TotalSupply  | Provides information about the total token supply                                 | $\checkmark$ | <b>√</b> | $\checkmark$ |  |  |
| BalanceOf    | Provides account balance of the owner's account                                   | $\checkmark$ | <b>√</b> | $\checkmark$ |  |  |
| Transfer     | Executes transfers of a specified number of tokens to a specified address         | <b>√</b>     | <b>√</b> | <b>√</b>     |  |  |
| TransferFrom | Executes transfers of a specified number of tokens from a specified address       | <b>√</b>     | <b>√</b> | <b>√</b>     |  |  |
| Approve      | Allow a spender to withdraw a set<br>number of tokens from a specified<br>account | 1            | <b>√</b> | ✓            |  |  |
| Allowance    | Returns a set number of tokens from a spender to the owner                        | <b>√</b>     | 1        | ✓            |  |  |

# Write functions of contract v1.0

# **Deployer cannot mint any new tokens**

| Name                 | Exist     | Tested | Status |
|----------------------|-----------|--------|--------|
| Deployer cannot mint | -         | _      | _      |
| Max / Total Supply   | 100000000 |        | 000000 |

# Deployer cannot burn or lock user funds

| Name                 | Exist        | Tested   | Status |
|----------------------|--------------|----------|--------|
| Deployer cannot lock | $\checkmark$ | <b>√</b> | X      |
| Deployer cannot burn | -            | _        | _      |

#### Comments:

#### **v1.0**

- Owner can lock user funds by
  - blacklisting addresses
  - Setting max tx amount to 0
- 4% fee is applied per transaction. 3% of that fee is distributed to holders, and 1%, up to 50% of the total supply, is permanently burned.

# **Deployer cannot pause the contract**

| Name                               | Exist | Tested | Status |
|------------------------------------|-------|--------|--------|
| Deployer cannot pause the contract | -     | _      | -      |

# **Deployer cannot set fees**

| Name   | Exist | Tested | Status |
|--|-------|--------|--------|
| Deployer cannot set fees over 25%                  | -     | -      | -      |
| Deployer cannot set fees to nearly 100% or to 100% | -     | _      | -      |

# Deployer can blacklist/antisnipe addresses

| Name  | Exist        | Tested   | Status |
|---|--------------|----------|--------|
| Deployer cannot blacklist/antisnipe addresses | $\checkmark$ | <b>√</b> | X      |

#### Comments:

#### **v1.0**

· Owner is able to blacklist addresses

# **Overall checkup (Smart Contract Security)**

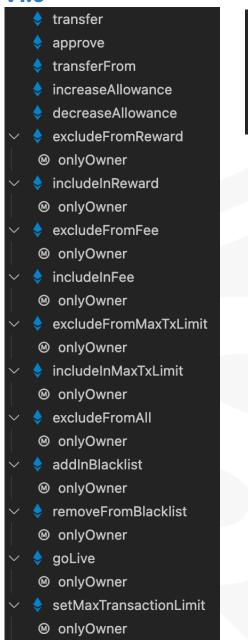

## Legend

| Attribute                | Symbol       |
|--------------------------|--------------|
| Verified / Checked       | $\checkmark$ |
| Partly Verified          | ×            |
| Unverified / Not checked | X            |
| Not available            | -            |

# **Modifiers and public functions**

#### **v1.0**

✓ \$ renounceOwnership
 Ø onlyOwner
 ✓ \$ transferOwnership
 Ø onlyOwner

#### **Comments**

- · Deployer can set following state variables without any limitations
  - maxTxLimit
- Deployer can enable/disable following state variables
  - \_isBlacklisted
  - isExcludedFromMaxTxLimit
  - isExcludedFromFee
  - \_isExcluded
  - excluded

- Existing Modifiers
  - onlyOwner
- Addresses that are excluded from fee can buy tokens before token goes live
- Sniper duration can be set without any limitation while going live with the token

Please check if an OnlyOwner or similar restrictive modifier has been forgotten.

# **Source Units in Scope** v1.0

| Туре     | File                   | Logic Contracts | Interfaces | Lines | nLines | nSLOC | Comment Lines | Complex. Score | Capabilities |
|----------|------------------------|-----------------|------------|-------|--------|-------|---------------|----------------|--------------|
| <b></b>  | contracts/contract.sol | 2               | 1          | 546   | 491    | 355   | 118           | 260            | *            |
| <b> </b> | Totals                 | 2               | 1          | 546   | 491    | 355   | 118           | 260            | *            |

# Legend

| Attribute        | Description   |
|------------------|---|
| Lines            | total lines of the source unit  |
| nLines           | normalised lines of the source unit (e.g. normalises functions spanning multiple lines)   |
| nSLOC            | normalised source lines of code (only source-code lines; no comments, no blank lines)   |
| Comment Lines    | lines containing single or block comments   |
| Complexity Score | a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces,) |

# **Audit Results**

## **Critical issues**

## No critical issues

# **High issues**

No high issues

#### **Medium** issues

No medium issues

## Low issues

No low issues

#### Informational issues

No informational issues

## **Audit Comments**

We recommend you to use the special form of comments (NatSpec Format, Follow link for more information <a href="https://docs.soliditylang.org/en/latest/natspec-format.html">https://docs.soliditylang.org/en/latest/natspec-format.html</a>) for your contracts to provide rich documentation for functions, return variables and more. This helps investors to make clear what those variables, functions etc. do.

### **27. Februrary 2023:**

 Please read the entire report and modifiers section for more information.

#### **Testing Results**

#### Polkastream contract

#### Deployment

- ✓ Should set the right owner
- ✓ Should set the right name
- ✓ Should set the right symbol
- ✓ Should mint the total supply
- ✓ Should assign 0 tokens to the owner
- ✓ Should correctly distribute the total supply among wallets
- ✓ Should exclude reserved wallets from rewards
- ✓ Should exclude reserved wallets from fees.

#### **Transactions**

- ✓ Should prevent spend before going live
- ✓ Should prevent spend greater than max tx limit

#### Blacklist

- ✓ Should prevent spends from Blacklisted wallets
- ✓ Should allow spends from Non-Blacklisted wallets
- ✓ Should blacklist buys close to going live
- ✓ Should NOT blacklist buys NOT close to going live

#### Claims

- ✓ Is the 4% per \$PSTR transaction fee calculated correctly?
  - Yes
- ✓ Is 75% of the per transaction fee distributed to all holders?
  - Yes
- ✓ Is 25% of the per transaction fee, up to 50% of the max \$PSTR supply, permanently burned?
  - Yes
- ✓ After 50% of the max supply is burned, will the per transaction fee revert to 4% with 100% of it distributed to all holders?
  - Yes
- ✓ Are all company wallets excluded from receiving or paying the per transaction fee before/after the 50% supply burn?
  - Yes
- ✓ Can owner modify the excluded wallets from the per transaction fee?
  - Yes
- ✓ Does \$PSTR have a per transaction limit and if so, how many \$PSTR is the limit?
  - Yes, the initial limit is one million \$PSTR
  - ✓ Can the per transaction limit be changed by owner?
    - Yes, to the full amount of smart contract
  - ✓ Who can change the \$PSTR smart contract owner?
    - The owner itself.

# **SWC Attacks**
