### **Disclaimer**

<u>SolidProof.io</u> reports are not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc'...)

SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof's position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

## **Description**

Wagon is a bridge between worlds of supply chain and blockchain technology. We believe that blockchain can solve the fragmented, disconnected and untrustworthy supply chain situations.

As it's challenging to hook traditional businesses such as supply chain to blockchain, a decentralised finance system based on profit share is prepared.

## **Project Engagement**

During the Date of 09 January 2022, **Wagon Network** engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

**Commit**: 069e3c3e0bc5e32bb79074d84c593a1797cef69c

## **Vulnerability & Risk Level**

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

| Level         | Value   | Vulnerability   | Risk (Required Action)  |
|---------------|---------|---|---|
| Critical      | 9 - 10  | A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.      | Immediate action to reduce risk level.                              |
| High          | 7 – 8.9 | A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way. | Implementation of corrective actions as soon aspossible.            |
| Medium        | 4 – 6.9 | A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.                                     | Implementation of corrective actions in a certain period.           |
| Low           | 2 – 3.9 | A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.       | Implementation of certain corrective actions or accepting the risk. |
| Informational | 0 – 1.9 | A vulnerability that<br>have informational<br>character but is not<br>effecting any of the<br>code.   | An observation that<br>does not determine<br>a level of risk        |

## <u>Auditing Strategy and Techniques</u> <u>Applied</u>

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

## Methodology

The auditing process follows a routine series of steps:

- 1. Code review that includes the following:
  - Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
  - ii) Manual review of code, which is the process of reading source code line-byline in an attempt to identify potential vulnerabilities.
  - iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
- 2. Testing and automated analysis that includes the following:
  - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
  - ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
- 3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
- 4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

## Used Code from other Frameworks/Smart Contracts (direct imports)

#### Imported packages:

- @openzeppelin/contracts/token/ERC20/ERC20.sol
- @openzeppelin/contracts/token/ERC20/extensions/ERC20Burnable.sol
- @openzeppelin/contracts/token/ERC20/extensions/ERC20Snapshot.sol
- @openzeppelin/contracts/token/ERC20/extensions/draft-ERC20Permit.sol
- @openzeppelin/contracts/token/ERC20/extensions/ERC20Votes.sol
- @openzeppelin/contracts/access/AccessControl.sol
- @openzeppelin/contracts/security/Pausable.sol

### **Tested Contract Files**

This audit covered the following files listed below with a SHA-1 Hash.

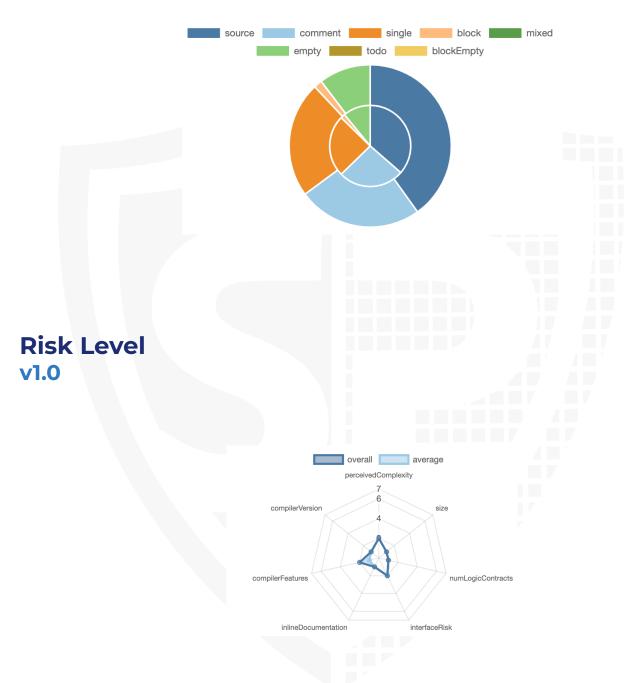

A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.

#### **v1.0**

| File Name           | SHA-1 Hash                                   |
|---------------------|--|
| contracts/Wagon.sol | 308586aef2259cf1bc532a76f5e6efd37792<br>eb72 |

## **Metrics**

## Source Lines v1.0

## **Capabilities**

## **Components**

#### **Exposed Functions**

This section lists functions that are explicitly declared public or payable. Please note that getter methods for public stateVars are not included.

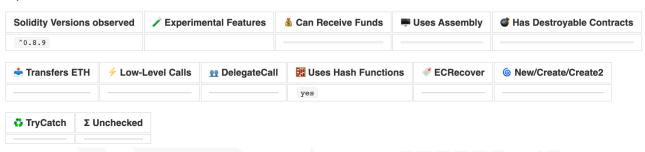

| External | Internal | Private | Pure | View |
|----------|----------|---------|------|------|
| 0        | 17       | 0       | 0    | 2    |

#### StateVariables

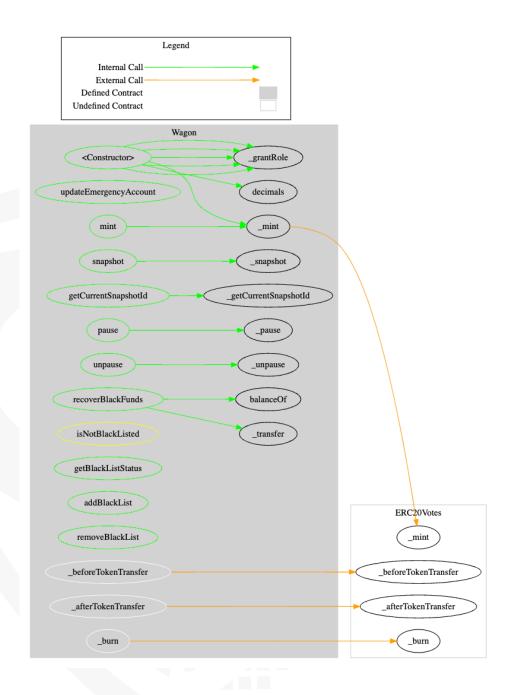

#### Capabilities

## Inheritance Graph v1.0

## CallGraph v1.0

## **Scope of Work/Verify Claims**

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

- 1. Is contract an upgradeable
- 2. Correct implementation of Token standard
- 3. Deployer cannot mint any new tokens
- 4. Deployer cannot burn or lock user funds
- 5. Deployer cannot pause the contract
- 6. Deployer cannot set fees
- 7. Deployer cannot blacklist/antisnipe addresses
- 8. Overall checkup (Smart Contract Security)

## Is contract an upgradeable

| Name                        |    |
|-----------------------------|----|
| Is contract an upgradeable? | No |

## **Correct implementation of Token standard**

|              | ERC20   |              |          |              |
|--------------|---|--------------|----------|--------------|
| Function     | Description   | Exist        | Tested   | Verified     |
| TotalSupply  | Provides information about the total token supply                                 | <b>√</b>     | <b>√</b> | ✓            |
| BalanceOf    | Provides account balance of the owner's account                                   | $\checkmark$ | <b>√</b> | $\checkmark$ |
| Transfer     | Executes transfers of a specified number of tokens to a specified address         | <b>√</b>     | <b>√</b> | ✓            |
| TransferFrom | Executes transfers of a specified number of tokens from a specified address       | <b>√</b>     | <b>√</b> | <b>√</b>     |
| Approve      | Allow a spender to withdraw a set<br>number of tokens from a specified<br>account | <b>√</b>     | <b>√</b> | <b>√</b>     |
| Allowance    | Returns a set number of tokens from a spender to the owner                        | <b>√</b>     | 1        | <b>√</b>     |

## Deployer cannot mint any new tokens

| Name                        | Exist         | Tested   | Status |
|-----------------------------|---------------|----------|--------|
| Deployer/Authority can mint | $\checkmark$  | <b>√</b> | X      |
| Initial Supply              | 1.000.000.000 |          |        |

#### Comments:

#### **v1.0**

• The owner can assign wallets the "Minter\_Role" and those accounts with the minter role can mint tokens.

## Deployer cannot burn or lock user funds

| Name                 | Exist        | Tested   | Status       |
|----------------------|--------------|----------|--------------|
| Deployer cannot lock | $\checkmark$ | <b>√</b> | $\checkmark$ |
| Deployer cannot burn | <b>√</b>     | <b>√</b> | <b>√</b>     |

#### Comments:

#### **v1.0**

Users can burn their own tokens and the tokens they have approval for.
 Just like the standard ERC20

## Deployer cannot pause the contract

| Name                         | Exist        | Tested   | Status |
|------------------------------|--------------|----------|--------|
| Deployer/Authority can pause | $\checkmark$ | <b>√</b> | X      |

#### Comments:

#### **v1.0**

• The owner can assign wallets the "PAUSER\_ROLE" and those accounts with the role can pause contracts.

## **Deployer cannot set fees**

| Name   | Exist | Tested | Status |
|--|-------|--------|--------|
| Deployer cannot set fees over 25%                  | -     | -      | -      |
| Deployer cannot set fees to nearly 100% or to 100% | -     | _      | _      |

## Deployer can blacklist/antisnipe addresses

| Name  | Exist        | Tested   | Status |
|---|--------------|----------|--------|
| Deployer cannot blacklist/antisnipe addresses | $\checkmark$ | <b>√</b> | ×      |

#### Comments:

#### **v1.0**

• The owner can assign wallets the "BLACKLISTER\_ROLE" and those accounts with this role can blacklist addresses.

## **Overall checkup (Smart Contract Security)**

### Legend

| Attribute                | Symbol       |
|--------------------------|--------------|
| Verified / Checked       | $\checkmark$ |
| Partly Verified          | ×            |
| Unverified / Not checked | X            |
| Not available            | -            |

## Modifiers and public functions v1.0

updateEmergencyAccount snapshot pause unpause mint addBlackList removeBlackList recoverBlackFunds 

### **Ownership Privileges:**

The owner can provide authorities to multiple wallets in the form of "ROLES". Accounts with these roles can perform certain actions with respect to their roles.

- The wallet with the "DEFAULT\_ADMIN\_ROLE" can perform the following actions:
  - Update emergency account
- The wallet with the "BLACKLISTER\_ROLE" can perform the following actions:
  - Transfer funds from blacklisted addresses to the emergency account

## **Source Units in Scope** v1.0

| File                | Logic Contracts | Interfaces | Lines | nLines | nSLOC | Comment Lines | Complex. Score |
|---------------------|-----------------|------------|-------|--------|-------|---------------|----------------|
| contracts/Wagon.sol | 1               |            | 182   | 168    | 83    | 60            | 87             |
| Totals              | 1               |            | 182   | 168    | 83    | 60            | 87             |

#### Legend

| 3 3 4            |   |
|------------------|---|
| Attribute        | Description   |
| Lines            | total lines of the source unit  |
| nLines           | normalised lines of the source unit (e.g. normalises functions spanning multiple lines)   |
| nSLOC            | normalised source lines of code (only source-code lines; no comments, no blank lines)   |
| Comment Lines    | lines containing single or block comments   |
| Complexity Score | a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces,) |

## **Audit Results**

### **Critical issues**

### No critical issues

## **High issues**

## No high issues

### **Medium issues**

#### No medium issues

### Low issues

| Issue | File | Type                            | Line        | Description  |
|-------|------|---------------------------------|-------------|--|
| #1    | Main | Missing zero address validation | 5,81,37,145 | Check that the address is not zero.  |
| #2    | Main | Floating Pragma                 |             | The current pragma Solidity directive is "^0.8.9". Contracts should be deployed with the same compiler version and flags that they have been tested thoroughly. Locking the pragma helps to ensure that contracts do not accidentally get deployed using other versions. |

## Informational issues

### No informational issues

### **Audit Comments**

We recommend you to use the special form of comments (NatSpec Format, Follow link for more information <a href="https://docs.soliditylang.org/en/latest/natspec-format.html">https://docs.soliditylang.org/en/latest/natspec-format.html</a>) for your contracts to provide rich documentation for functions, return variables and more. This helps investors to make clear what that variables, functions etc. do.

#### 10. December 2022:

· Read whole report and modifiers section for more information

## **SWC Attacks**

| ID                                   | Title  | Relationships  | Status |
|--------------------------------------|--|--|--------|
